CommerceIQ

Intelligent automation for profitable ecommerce growth

Amazon Co-Pilot - Product Box

CommerceIQ Amazon Co-Pilot is an integrated product solution combining three (3) previously standalone products: that were earlier known as eCommerce Sales Management (ESM), Profit Recovery Automation (PRA) and Market Share.

Product Name: eCommerce Sales Management (ESM)

Scope of ESM

CIQ's Ecommerce Sales Management (ESM) product enables customers to consolidate and review multiple sales related metrics within a single view. It also delivers actionable SKU-level recommendations designed to drive sales growth and improve operational efficiency.

Retailer access Instructions / Reports Needed to enable ESM

TBD

Geographies Supported

- US
- Canada
- Mexico
- Australia
- United Kingdom
- Germany
- Italy
- France
- Spain
- Pan EU (BO view only)
- Netherlands
- Poland

Key Features

Amazon 1P

1) Business Overview

Description: The Business Overview Dashboard provides insights into trendlines and correlations across 50+ metrics encompassing sales, operations and advertising (where applicable). It enables you to identify performance drivers and compare metrics across different business lines, generate high quality PDF reports, and save reusable reports as custom "Views" for future comparison and analysis.

Metric List - Link

Detailed Features List - Link

Retailer: Amazon

2) Recommendations

Description: The Recommendation feature is a curated list of SKUs that exhibit deviations from the intended value, Source of Truth data or behaviors that negatively impact brands. These Recommendations are primarily grouped into three (3) categories: Sales, Operations and Marketing metrics. Currently, Recommendations are standard and not customizable, offering an "out-of-the-box" solution for all ESM users. Users can download the output table, subscribe [to updates?, and make adjustments to the list of metric columns supported.

List of Recommendations - Link

3) Automations

Description : CommerceIQ offers six (6) automated workflows designed to detect deviations from the Source of Truth (SOT) and automatically raise tickets with the relevant retailer for resolution. These automations address the following:

-

Unavailable SKUs
3P Variants
Duplicate Listings
Content Authority
Variation Authority
PO Discrepancy

-

Detailed description & use case - Link

Availability Matrix by Region

Automation Type	US	CA	MX	UK	DE	FR	IT	ES	NL	PL	Australia
Unavailable	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
3P Variant	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Duplicate Listings	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Variation Authority	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Content Authority	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
PO Discrepancy	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes

4) SKU Details Page

Description: This feature offers detailed graphs and data for a selected SKU across a wide variety of metrics within a user-specified time frame. This viewIt enables users to see the interplay between various metrics (e.g., sales performance on days when “Amazon’s Choice” was displayed, providing valuable insights, in particular for top sales generating ASINs.

Retailer: Amazon

5) Reporting

Description: CommerceIQ’s Reporting Tool seamlessly integrates data across the CIQ platform, offering users with real-time, 360° visibility into sales, operations, inventory, digital shelf, and retail media metrics. This tool includes out-of-the-box reporting and dashboards that are easy to use, fully customizable, and actionable.

Beyond creating reports, the platform enables customers to . (i) download data for offline analysis, (ii) edit reports to refine insights, and (iii) share reports with teams for collaborative decision-making.

a) Recurring Report

Description: Recurring Reports are customer created, on-demand reports designed for efficiency With an intuitive interface, customers can effortlessly design reports featuring one or more customizable widgets that provide deep insights and enhance data consumption. Each widget can be tailored to visualize data in the most meaningful way for your business.

Recurring Reports are delivered to your Inbox - Link

b) **Standard Report**

Description: Standard Reports are a pre-set of configured out-of-the-box reports provided by CommerceQ. These reports are available for all customers.

Retailer: All available retailers

Here's the link to the latest update with regard to reporting capabilities

6) Data Export

Description: A comprehensive data export tool that enables customers to extract ESM and RMM metrics for Amazon. The export process is customizable, enabling users to configure dimensions, aggregations and time ranges. Users can save custom formats for future use and easily re-download the data again as needed.

Retailer: Amazon

7) Real time Sale Report (on Tableau)

Description: Accessible in the reporting section, this view provides near real time sales data with a maximum data lag of four hours. Currently, Amazon supplies real-time metrics for OPS and ordered units available through this tool. This tool is very effective during tentpole or sales events, offering hourly reporting to support timely business decisions.

Retailer: Amazon

8) Content Scorecard

Description: The Content Score is measure of the quality of content on product display pages, calculated using a predefined set of parameters and thresholds. The dashboard analyzes each of the parameters to determine whether the content for a given SKU meets or exceeds the threshold. Based on the number of parameters meeting the criteria, a content score is generated for each SKU. For example, If the SKU exceeds the threshold for 8 out of 10 parameters, its content score will be 80%.

Retailer: Amazon

9) Chrome Plugin

Description: CommerceIQ's browser extension provides instant insights into your Amazon business directly on the product detail page (PDP). Key metrics such as Revenue, Shipped COGS, Advertising Spend, and more are available for all your SKUs, important events like out-of-stock (OOS) dates, content changes, and lost buy box occurrences. Trend lines to help you identify which events influenced these trends. By consolidating many data points into a single view, this extension simplifies decision-making and enhances efficiency.

Retailer: Amazon

10) Sales forecast

Description: The forecast dashboard allows Brand to decide **how many units to produce** in the coming weeks based on demand. While **Amazon provides forecasts**, they are optimized for **consumer demand**, not vendor shipments, often leading to **over- or under-forecasting**. This misalignment can cause **stockouts or excess inventory**, impacting sales. This page also helps customers **analyze Amazon's forecast alongside past performance** to make more accurate inventory procurement decisions.

Retailer: Amazon

11) PO fill rate

Description: PO Fill Rate dashboard helps customers to check the past and ongoing Purchase Orders. Customers can also check the amount of revenue that they have lost because of the unfulfilled purchase orders.
SKU Level summary can help dig deeper into the insights of cases/units submitted/accepted by clients and revenue lost due to unfulfilled POs. Further, customers can look into PO details on SKU Level as well.

Retailer: Amazon

Amazon 3P

The ESM product supports connectivity to 3P accounts through Amazon Seller Central). For customers, this feature is accessible via a separate dropdown under the retailer switcher.

Notes:

- No Sales Ops Automations: Sales Ops Automations are not supported for 3P accounts
- Roadmap Update: No significant investments are planned for 3P support over the next 2 quarters
- No Advertising Metrics or Features are part of setup.

1. Business Overview

Not as comprehensive as the 1P dashboard, the Business Overview feature for 3P provides Sales metrics to help customers monitor performance. Click here for list of supported metrics

2. Reports & Data Export

Description: A comprehensive data export tool that enables customers to extract standard metrics for Amazon based on user-configured dimensions, and time range. Users can save custom formats for reuse and conveniently re-download data as needed.

Click here for list of supported Sales metrics.
PS: Advertising Metrics are not part of setup.

3. **SKU / SKU Details Page**

   Description: This feature provides detailed graphs and data for a specific SKU across a variety of metrics within a user-selected time frame. This view is helpful to see the interplay of various metrics (e.g., sales on days when "Amazon's Choice" was displayed) especially for top sales generating ASINs.

Amazon Hybrid (1P + 3P)

1. **Business Overview**

   Description: Overview dashboard to compare metrics for Amazon across 1P and 3P businesses.
   PS: Not all metrics in the list are available for 3P, please check the dashboard.

Amazon Fresh

CommerceIQ's offering for the Amazon Fresh program is currently limited to two dashboards with a focus on important insights:

1. **Business Overview**
   Provides visibility into sales and inventory related metrics.

   Click link for the list of supported metrics

2. **Regional Availability**
   Offers a comprehensive availability view of the Top 100 SKUs across Top 50 Zip Codes. The list of zip codes can be configured per client's requests.

Notes:

1) No Automations: Automations are not currently supported for the Amazon Fresh program.
2) Roadmap Update: No significant investments planned for the Amazon Fresh program in the next 2 quarters

---

Product Name: Market Share

Scope of Market Share

Market Share is available for the following Geographies:

Amazon US, CA, France, Germany, UK, Italy and Spain.

Note: For any category in the EU5 (France, Germany, UK, Italy, and Spain), a feasibility study **must** be conducted to evaluate the accuracy and reliability of results before committing. Limited customer data in these regions results in fewer training data points, which may affect the accuracy of Market Share calculations.

Requirements to to enable Market Share:

1. ESM: Must be enabled.

2. AMS API Access: Access to the Amazon Marketing Service (AMS) API is required for the relevant geography (this can be obtained from any country).

3. Action Required. Before committing to a customer, a feasibility study must be performed to assess data availability and the ability to calculate Market Share for the requested category.

Categories Supported

Geography	# Categories Supported
US	650+
CA	150+
UK	125+
FR	90+
DE	80+
ES	80+
IT	90+

For a more detailed breakdown please refer to: Categories Supported | Market Share

1P/3P/Fresh capabilities

Market Share is only available for 1P vendors selling on Amazon.com.

Amazon Fresh: Market Share is not supported for Amazon Fresh sellers.

3P sellers (via Seller Central): Market Share is not available for 3P sellers on Amazon Seller Central.

Offering

Customers can select their interested set of category(ies) from the list (pricing calculator). There are 2 options available:

1. Use of CIQ Taxonomy: The custom taxonomy adheres to the hierarchy presented in the CIQ taxonomy. Additional customizations, such as creating sub-categories or filters beyond the existing categories, are not permitted. However, customers have the option to combine multiple existing categories into a single category. For example: If a customer selects Cat Food and Dog Food, they can combine these into a single category labeled Pet food.
2. Custom Taxonomy: Customers have the option to further break down existing the categories into subcategories, subject to feasibility as determined by CommerceIQ. Ffor example, if a customer selects the category Dry Dog Food, they may create subcategories such as ry Dog Food for Adult Dogs and Dry Dog Food for Puppies. During the onboarding process, customers must provide the complete list of desired categories and subcategories to the onboarding team. Once onboarding is completed and final, no further changes will be entertained. However,
customers are permitted up to two (2) changes per category per year to create subcategories or filters within the existing data. The changes cannot not include any changes to the agreed scope. For example, if the customer's contract covers only Dry Dog Food, the customer cannot add a new category such as Wet Dog Food., Customization is strictly limited to slicing or reorganizing the existing data.

Key Features

1. **Categorization and Estimation Models**
    a. **Category Definition**
    A **category** represents a specific grouping within a broader market or industry, defined by its distinct functionality and physical attributes.
    Examples of Categories:
    Air Fryer, Yoga Mat, Coffee Machine

    A **subcategory** is a refined subdivision within a category, representing the smallest

distinct business unit for which market share reporting is desired by the customer.

Examples of subcategories within the
Coffee Machine category:

1.1.Milk Frother
1.2.Espresso Machine
1.3.Cold Brew Machines

b. Sales Estimation

We crawl all SKUs within the category daily,c capturing publicly available metrics such as BSR categories, BSR rank, reviews, ratings, and other relevant metrics. Using these metrics and daily sales data of your ASINs (from Amazon Vendor Central - AVC), our model establishes a correlation between the sales performance and the other captured metrics.

Sales estimation data is provided at a weekly granularity and at theASIN level for actionable insights.

c. Accuracy

Our Market Share model achieves brand-level accuracy in the range of 85 - 90% when compared against ABVP (Amazon Brand View Pro) data..

2. Dashboard

a. Overview Page

This page provides a high-level view of performance across all categories. Users can drill down into subcategories to identify which segments are driving changes in market share. Key metrics, such as Availability, Lost Buy Box, and Ad Spend, are available to help identify factors influencing performance changes. Additionally, this page enables tracking of Market Share fluctuations over time.

b. Category Page

This page delivers insights into the brands operating within a category and their performance.

This page delivers information about a category or subcategory, enabling you to compare the performance your brands or manufacturers against competitors within the same category. You can access estimated sales data for competitor brands, along with their market share. Additionally, this page presents trends in market share, category size, and sales for both your brands and competitor brands.

c. **SKUs page**

This page provides a detailed breakdown of metrics at the SKU level, offering insights into sales data (both 1P and 3P), number of units sold (both 1P and 3P), ASP and other detailed information on brand, manufacturer, category, and other relevant attributes, such as color, age group, etc.

d. Key Metrics Available at a SKU Level:

<u>Estimated Sales (Units)</u>: Represents he estimated number of units sold by ASINs during the selected time period. For your ASINs, actual sales data as reported by AVC. For competitor ASINs, sales are estimated using CommerceIQ's estimation model. (as mentioned above).

<u>Estimated Sales ($)</u>: Represents the estimated total sales value (in dollars) of an ASIN/brand during the selected time period. For your ASINs, actual sales data as

reported by AVC. For competitor ASINs, sales are calculated by multiplying the estimated units sold by Average Selling Price (ASP).

Market Share ($): Market Share of the brand/Manufacturer or ASIN during the selected time period. Market Share is computed as (Sales ($) of the brand/Manufacturer or ASIN) out of the (Total Sales ($) of all brand/Manufacturer or ASINs in the category).

Market Share (units): Market Share of the brand/Manufacturer or ASIN during the selected time period. Market Share is computed as (Sales (units) of the brand/Manufacturer or ASIN) out of the (Total Sales (units) of all brand/Manufacturer or ASINs in the category).

Estimated sales ($) (1P): Refers to the sales revenue generated when Amazon acts as the seller. For your ASINs, the sales data is obtained directly from AVC. For competitor ASINs, the 1P sales are estimated based on the percentage of instances when Amazon won the Buy Box during the selected time period.

Estimated sales ($) (3P): Refers to the sales revenue generated when Amazon is not the seller. For your ASINs, the 3P sales are estimated by analyzing the percentage of instances when Amazon did not win the Buy Box. This percentage is then applied to the 1P sales data from AVC to derive the 3P sales estimate. For a competitor ASINs, the 3P sales are estimated by determining the percentage of instances when Amazon lost the Buy Box and using this percentage to estimate their sales.

Estimated units sold (1P): Refers to the number of units sold Amazon is not the seller. For your ASINs, the 3P units sold are estimated by analyzing the percentage of instances where Amazon did not win the Buy Box. This percentage is then applied to the 1P units sold from AVC to calculate the estimated the 3P units sold. For a competitor ASINs, the 3P units sold are estimated by determining the percentage of instances when Amazon lost the Buy Box and using this percentage to derive estimated units sold for competitors.

Estimated units sold (3P): Refers to the estimated number of units sold when Amazon is not the seller. For your ASINs, the 3P units sold are calculated by analyzing the percentage of instances where Amazon did not win the Buy Box. This percentage is applied to the 1P unit sales data from AVC to estimate the 3P unit sales. For a competitor ASINs, the 3P units sold are estimated by analyzing the percentage instances when Amazon lost the Buy Box and using this data to calculate the competitor's estimated units sold..

Dashboard Configurations. All dashboards provides the flexibility to configure data views based on your desired preferences to enable insights tailored to your business needs. Key configurations options include:

- View Market Share by Brands vs Manufacturers
- View Market Share by r sales or by units sold
- View for 1P vs 3P configurations:
    - **1P + 3P out of 1P + 3P of the market**
      Calculates Market Share taking into consideration sales of your brands by 1P and 3P sellers out of the 1P + 3P sales of the entire market. The inclusion of 3P

sales helps in understanding the total share of your brands (1P + 3P sales) in the Entire Market (1P + 3P sales).

- **1P out of 1P + 3P of the market**
  Calculates Market Share by including both 1P + 3P sales of your brands, compared against the total market sales (1P + 3P). This view provides an understanding of your total brand share in the entire market.
- **1P out of 1P Market**
  Calculates Market Share (%) by considering only the sales made by 1P sellers. This metric excludes all 3P sales from your brand's sales and the total market, offering insights into your 1P share within the entire 1P market
- **3P out of 3P Market**
  Calculates Market Share (%) by considering only the sales made by 3P sellers. This metric excludes all 1P sales from both your brand's sales and the total market, providing a view of your total 3P share within the entire 3P market.

- **Self serve SKU categorization:** Users can Add, Move, or Remove SKUs via the UI. Weekly refreshes, real-time previews, and transparent history logs ensure high accuracy and full visibility into classification changes. The feature can be accessed from the "SKUs classification" tab under the View SKU page
  - Key Capabilities (changes reflected after 1 week)
    - Reclassify Existing SKUs
    - Change the category of any SKU through an intuitive interface.
    - Remove Unwanted or Misclassified SKUs
  - Start tracking new or newly launched SKUs by associating them with the right categories. (changes reflected within 3-4 weeks)
    - Add New SKUs to Market Share Categories
  - Know exactly when your changes will reflect and preview their impact immediately.
    - Real-Time ETA and Preview
    - Change History & Audit Trail
    - Track every update with transparent logs for accountability.

Product Name: Profit Recovery Automation

Scope of PRA

CommerceIQ's Profit Recovery Automation (PRA) streamlines the intricate process of financial reconciliation into a seamless, automated process, enabling customers to reclaim lost revenue with precision and ease. By automating this process, PRA helps ensure that every potential recovery is captured, thereby enhancing the financial health of its users.

Reports Needed to enable PRA

- DisputeManagement
- PriceVarianceVsdFromDisputeManagement (vsd - view dispute details)
- VsdFromDisputeManagement (vsd - view dispute details)

- ViewInvoiceDetails
- AllInvoiceSummary
- DisputeIdLevelDateDetails
- ViewCaseLogsDetails
- ShortageInvoiceSummary
- ChargebackReport
- PaymentsReports
- PriceVarianceInvoiceSummary
- PriceVarianceLineItems

Geographies Supported

As of Q1 2025, The PRA solution is currently available for Amazon US, UK, DE, CA, FR, IT and ES regions.

Note: While we have the capability to support PRA in any region, our current focus is limited to the regions specified above, based on existing customer demand. For any new regions, prior approval from the CommerceIQ Product team is required. Additionally, access to the Vendor Central account will be necessary to evaluate feasibility and ensure proper implementation.

Automation / Details	**US**	**CA**	**MX**	**UK**	**DE**	**FR**	**IT**	**ES**	**NL**	**PL**	**Australia**

Deductions Overview Dashboard	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes

Key Features

1) Profit Recovery Automation Overview

Description: The overview provides the journey map of the invoices and a high-level overview of efforts made by CIQ to recover shortages. The Journey Map breaks out the dollars recovered by Phase 1 Disputes and Phase 2 Disputes, along with allowing clients to export line-item invoice data for internal reconciliation.

2) Deductions Overview

Description: This Dashboard aims to draw contrasts between gross sales and all the deductions imposed by amazon on gross sales. Gross sales are derived by calculating the total dollar amount invoiced by a vendor to amazon for payment. This dashboard is anchored around the invoice date i.e. the date on which a vendor submitted an invoice to Amazon for payment, and shows the subsequent deductions, disputes and repayments (if any) against the same invoices.

Detailed Features - Link

3) Co-Op Overview

Description: This dashboard is anchored around the co-op invoice date i.e. the date on which Amazon submitted a co-op invoice to a vendor and aims to draw contrasts between gross sales and co-op deductions levied by amazon for the selected time period. Gross sales are derived by calculating the total dollar amount invoiced by a vendor to amazon for payment. Co-op deductions comprise of various sub-types such as Accruals, Vendor Funded Sales Discounts, Straight Payments etc., and this data can be tracked under the Co Op section of Vendor Central (Payments > Co Op). However, at this point in time, CommerceIQ's automations only go after the Accrual sub-type of co-op deductions, which typically happens to be the biggest contributor to a brand's overall co-op deductions.

Detailed Features - Link

4) Shortages

Description: The Shortages Dashboard provides a comprehensive view of PQV (i.e shortages) enabling clients to monitor and manage their shortage disputes effectively.The widgets in the dashboard allow the clients to change the metrics they are viewing to measure things like how well they are performing as a % of Shipped COGS.

Detailed Features - Link

5) Price Variance

Description: The PPV Dashboard offers a detailed view of price variance issues, allowing clients to monitor and manage their price variance disputes effectively. The widgets in the dashboard allow the clients to track PPV disputes, dispute approvals. Clients can view granular data at an PO-ASIN level to track CIQ's status on disputes along with other relevant information regarding the price variance occurrences.

Detailed Features - Link

6) Chargebacks

Description: The Chargebacks Dashboard provides an in-depth view of chargeback issues, enabling clients to monitor chargebacks and related disputes effectively. The widgets in the dashboard allow the clients to track chargebacks along with dispute progress over a given period of time. Clients can also drill down to a specific chargeback issue type by selecting a specific chargeback Issue type.

Detailed Features - Link

7) Shipment Tracker

Description: The Shipment Overview section provides vendors with a comprehensive summary of their shipments at both the Purchase Order (PO) and SKU levels. This overview includes key details such as the PO number, shipment status, and relevant dates (e.g., order date, shipping window). Vendors can also view product-specific information, including SKU details, product titles, ordered and received quantities, and financial metrics like case cost and total cost.

The Shipment Overview is essential for tracking the fulfillment of orders, identifying discrepancies between ordered and received quantities, and managing the financial aspects of shipments. This information helps vendors ensure that their products are being accurately and timely received by Amazon's fulfillment centers, directly impacting product availability and vendor performance.

Complete guide to PRA -

PRA Roles & Responsibilties

Profit Recovery Automation (PRA): Product Guide

APPENDIX

Types of Recommendations

Types of Recommendation / Alert	Description	Optional Configuration - Yes/No
Unavailable SKUs	SKUs that are not available for sale on Amazon for one of the of three following reasons: 1. Unavailable: Absence of buybox and text indicating unavailability 2. OOS: Absence of buybox or lack of buybox offer from Amazon. 3. Suppressed: Dog pictures instead of detail page.	No
3P Variants	Identifies SKUs on your PDP which are not from your catalog but being sold by a 3P.	No
Lost Buy Box	Identifies SKUs where Amazon is one of the sellers but BuyBox is won by a 3P seller which is due to pricing issues most of the time.	No
Predictive Out of Stock	Identifies SKUs which are likely to go OOS within the fulfillment window based on current inventory level and expected sales velocity. The sales velocity ignores outliers due to temporary spike in sales	No

Change in Amazon Forecast	Identifies SKUs where the next 6 weeks forecast has changed by more than 20%. Mean forecast value from ARAP is used.	No
Sales Drop	Identifies and surfaces SKUs with a significant drop in weekly ordered product sales. A significant drop is determined by analyzing median and standard deviation sales drop for catalog SKUs, so as to only surface SKUs with a significant change in sales and also excluding sales drops due to seasonality	No
Sales Increase	Identifies and surfaces SKUs with a significant increase in weekly ordered product sales. A significant increase is determined by analyzing median and standard deviation sales increase for catalog SKUs, so as to only surface SKUs with a significant change in sales and also excluding sales increase due to seasonality.	No
Predicted CRaP	Identifies SKUs where the gross Amazon margins are low due to price war or unilateral price changes and flags potential CRaP candidates.	No
Change in Variants	Identifies SKUs with change in the status (example: became Add-on or Prime Exclusive, Dropped Subscribe & Save or Amazon Choice badge or Bestseller badge)	No
Change in Amazon Program Status		No
Suppressed SKUs		No

Search Entry to Page 1	Identifies SKUs which have entered page 1 on important keywords and share of page 1 has increased.	No
Search Exit from Page 1	Identifies SKUs which have exited page 1 on important keywords and share of page 1 has decreased	No
Content Change	Identifies all the SKUs where content has been changed.	No
Competitor Out of Stock	Identified OOS SKUs from competing brands. These are identified from search results pages for keywords being tracked. The list is refreshed every alternate day.	No
Competitor Promo	Identified SKUs from competing brands that are on promotion. These are identified from search results pages for keywords being tracked. The list is refreshed every alternate day	No
Independent 3P Listings	Identifies independently listed SKUs by third-party sellers bearing one of the 1P brands. These SKUs are identified primarily from search results pages across keywords being tracked. The list is refreshed every alternate day	No
PO Discrepancy	Identify POs where case size, COGS or SKU ID are wrong and address them proactively without affecting PO Fill Rate metric.	No
Duplicate Listing	Identifies SKUs which are listed by 3P sellers and are duplicates of 1P SKUs.	No

Details of Automation Capabilities

1) **<u>Unavailable SKUs</u>**
(Erroneous OOS, Unavailable with inventory & Suppressed ASINs)

- **Context :** Oftentimes, there is a lack of a Buy-Box or products are highlighted as “Out of Stock” on Amazon despite having sufficient inventories. Additionally, there are times when certain products cannot be found on Amazon (a 404 page not found error showcasing a dog, humorously called “Dogs of Amazon”). The drivers of these issues are not definitively understood. It may be platform glitches, or human errors when processing shipments at scale. Amazon routinely suspends products for lack of compliance on content, packaging or health guidelines. Items are also suppressed if unprofitable or if associated with a high number of customer complaints at which point, the entire stock may be placed under review.

- **Customer Pain Points :**

  Revenue Impact: Having items that are suppressed or incorrectly identified as OOS or unavailable leads to lower sell-throughs for products and thus fewer POs generated in the future by Amazon.

  Brand Equity: To a lesser degree, inability to buy products drives a poor shopper experience and creates a negative shopper perception of the brand.

- **CIQ’s Automation :**

  Unavailable SKUs automation helps in reinstating the SKUs which are not available for sale in spite of having inventory. Reinstating SKUs helps in preventing revenue loss due to ASIN not being available for sale. In case of this occurrence CommerceIQ’s system automatically generates a ticket with Amazon to reinstate the SKU.

- **Value Provided :**

  Constant monitoring of ASINS to identify ones that are unavailable, comparing it against inventory levels on AVC as well as logging tickets across 500+ ASINs is just not feasible for client teams. We estimate a net positive revenue impact of 1% - 2% of total Amazon OPS for our customers. We currently have 95% of our customers leveraging this automation.

2) 3P Variants

- **Context :** Brands spend a lot of money on marketing & advertising to get customers into their product pages (PDP) and buy their products. Often, unauthorized sellers buy products in bulk from liquidation stores, other countries etc. and attempt to “re-sell” these products on Amazon either by:

    - Linking similar products onto the 1P item’s PDP via a false variation tag vs. competing for the Buy Box (or) creating multi-packs and bundles that are not authorized by the brand and varying on the 1P pages.

- **Customer Pain Points:**

  Revenue Impact: Redirection of shoppers away from the 1P product lowers Amazon’s replenishment volumes and ultimately drives revenue leakage for our clients.

  Brand Equity: The 3P variant pages generally also have poor content and inconsistent pricing which negatively affects the brand’s value and shopper price perception. Additionally, these sellers sometimes advertise at lower prices, but tack on higher shipping charges or have longer delivery windows which impacts shopper experience and future conversions.

  Legal: There may also be legal implications for the brand if 3P sellers attach product variants that may have exclusivity agreements. For example, there may be unique B2B specific SKUs sold in large pack sizes at club warehouses like Costco. Unauthorized 3P sellers would buy such products and resell them as singletons on Amazon - which would violate exclusivity agreements that the brand may have with Costco.

- **CIQ’s Automation :**

  3P variant automation helps in keeping the Amazon PDP free of any third-party variants. This automation prevents 3P variants from eating away revenue from you. CommerceIQ identifies all the third-party SKUs attached to your SKUs and generates a ticket with Amazon to remove the SKUs from your PDP.

- **Value Provided :**

  The 3P Variant automation is one of the biggest value drivers that we offer to our customers and is also the most sought after. It is part of the core standard features of the product. Brand eCommerce teams tend to be small (3-5 people) and constant monitoring of item PDPs as well as logging tickets across 500+ ASINs is just not feasible for them. Our analysis indicates that each customer will need at least 0.5-1 FTE dedicated full time

for this. Tickets usually get resolved within 3-6 hours and we see a fairly high success rate (% of tickets that get resolved) of ~99.6%.

3) Duplicate listings

- **Context :** As multiple sellers can sell the same product on Amazon's marketplace, the Buy Box was created in order to give the customer the best possible value for their money. Multiple suppliers (including Amazon itself) compete to "Win the Buy Box". Amazon algorithmically identifies which seller should be awarded the Buy Box based on their pricing for the product and historic performance.

  Rogue 3P sellers often game Amazon's New Item Setup (NIS) process and create new ASINs with fabricated UPCs instead of bidding and making offers on existing 1P ASINs. They do it to get sales without competing for the Buy Box, oftentimes at higher price points and longer delivery timeframes. These sellers leverage existing traffic and drive sales to their products if a shopper unknowingly stumbles on the product pages for these unauthorized products.

- **Customer Pain Points :**

  Revenue Impact: Redirection of shoppers away from the authorized 1P product page lowers Amazon's replenishment volumes and ultimately drives revenue leakage for our clients.

  Brand Equity: The 3P duplicate pages generally also have poor content and inconsistent pricing which negatively affects the brand's value and shopper price perception. Additionally, these sellers sometimes advertise at lower prices, but tack on higher shipping charges or have longer delivery windows which impacts shopper experience and future conversions

  Legal: There may be legal ramifications if key content around legal disclaimers is missing from such pages. There is also a risk of counterfeit and fake products being sold due to lesser oversight on these duplicate pages.

- **CIQ's Automation :**

  Duplicate Listing automations help in removing the duplicate listed ASINs on Amazon and hence prevent sharing of revenue between 1P SKU and the duplicate SKU.

- **Value Provided :**

  Constant monitoring of search results to find duplicate listings as well as logging tickets across 500+ ASINs is just not feasible for client teams. We estimate a net positive revenue impact of 0.25% of total Amazon OPS for our customers. This automation is currently running for 70% of our customers.

4) Content Authority

- **Context :** All brand manufacturers invest heavily in creating the right content for Amazon's PDPs. In addition to compliance with their brand guidelines, this content also helps with product discoverability and providing relevant information during a shopper's "Search" and "Research" journey. However, brands don't control their pages exclusively. If a 3P seller wins the Buybox, they get authority to change content. PDP components such as titles, description, bullets and legal information are often updated by unauthorized 3P sellers. This content is often of poor quality or contains incorrect information.

- **Customer Pain Points:**

  Revenue Impact: Poor content quality (e.g. omission of certain keywords) negatively impacts product discoverability, and thus glance views, conversions and ultimately revenues. Shoppers looking for specific products may not purchase if key information (e.g.,nutritional information) is missing from the brand's pages.

  Brand Equity: Unapproved, incorrect or missing content impacts brands value and equity as shoppers may start to perceive the brand more negatively.

  Legal: There may be legal ramifications and even potential lawsuits if content around disclaimers, ingredients etc. is incorrect or missing from brand pages.

- **CIQ's Automation :**

  Content Authority automation keeps the content on Amazon the same as what is designed by you. Correct content on PDPs helps in improving search rank and also prevents wrong content being present on the PDP. In case a discrepancy is noted, CommerceIQ's system automatically generates a ticket with Amazon to correct the content.

- **Value Provided :**

  Constant monitoring of ASINS to find content discrepancies as well as logging tickets across 500+ ASINs is just not feasible for client teams. While this automation is currently

inactive, customers still have the ability to view content changes on their PDPs. We have historically experienced resolution rates of ~80%.

5) Variation Authority

- **Context :** Variations are related SKUs with minor differences to suit shopper preferences (e.g., different flavors, colors, fragrances, sizes, pack-sizes of the same base SKU). The parent ASIN is a non-buyable entity used to connect child products. Through "Variations", brands can highlight several options to suit a shopper's preferences vs. sifting through several search results. Variations also help boost visibility for less popular variants by attaching it to more popular items with higher sales rank and reviews.

- **Customer Pain Points :**

  Revenue Impact: Loss of discoverability and thus conversion, especially for the less popular variants, drives sub-optimal revenue for our clients.

  Brand Equity: Lack of visibility into the available options impacts a shopper's perception of the brand and thus dilutes brand equity.

- **CIQ's Automation :**

  Variation Authority helps in keeping all the 1P variants of an SKU together on a single PDP. Keeping all variants together helps in improving discoverability.

- **Value Provided :**

  Constant monitoring of ASINS to find orphan variations as well as logging tickets across 500+ ASINs is just not feasible for client teams. This automation is currently running for 44% of our customers. We see resolution rates of ~80%. Situations when the merge is denied are often driven by some of the variants being Out-of-Stock.

6) PO Discrepancy

- **Context:** CPG assortments are complex due to a variety of flavors, pack sizes, cases, palettes etc. that need to be managed. Companies also make frequent updates to their catalog with brand new products, variations and costs. CPG companies supply Amazon with a variety of SKU level information & attributes like case size, case cost, minimum order quantity, SKU ID, UPC etc. which forms the basis for a Purchase Order. Amazon often submits POs with errors such as incorrect case size or case cost, likely driven by

human errors or Amazon's internal systems being out of sync. There may be POs submitted for inactive ASINs or with an incorrect SKU ID. When such POs are processed at client warehouses, the customer servicing teams that Pick, Pack & Ship orders end up sending the wrong quantities or products.

- **Customer Pain Points:**

  Revenue Impact: Unfulfilled POs drive sub-optimal replenishment to Amazon, creating potential OOS (Out-of-Stock) situation for brand's SKUs on Amazon.com and ultimately, lowering revenue potential.

  Cost Impact: Rejecting multiple POs also drives sub-optimal carrier utilization leading to higher cost to serve for the brand as the trucking costs are spread over fewer quantities of product. Furthermore, Amazon also penalizes brands for unfulfilled and non-receipt of products via "shortages" & "chargebacks".

- **CIQ's Automation :**

  Identify POs where case size, COGS or SKU ID are wrong and address them proactively without affecting PO Fill Rate metric.

- **Value Provided :**

  CPG Companies have teams that constantly review POs for discrepancies. Advanced CPG companies have built-in checks within SAP to reject such POs. Most CPG companies end up rejecting high volumes of POs due to data errors. Given the volume of PO Audits, companies often don't have the bandwidth to go back to Amazon and get their information rectified. Our automation helps ensure that future POs are error-free and brands experience fewer stockouts over time. We see fairly strong resolution rates of ~95% - 100%.

Details of Business Overview & Insights

1. Performance Overview

This widget provides the ability to analyze trendlines and understand correlations across 20+ sales, operations metrics and 30+ advertising metrics. This widget can be used to check the performance of the entire business or a particular business segment. You can select up to 6 different metrics and analyze the trendlines of 3 metrics at any given time and also download the data on the selected metrics.

1. **Add filters:** This allows you to add Internal / Amazon taxonomy filters to the dashboard. Applying this filter will pivot the entire dashboard to show data based on the selected filter. For example: Adding a filter for a brand will show all the data of the selected brand.

2. Metrics cards: This shows the value of the chosen metrics for the selected date range. The same metrics can be plotted on the graph by clicking on the card. A maximum of 3 trendlines can be plotted at any given moment.

3. Metrics selection: Provides an option to select from more than 20+ sales, operations metrics and 30+ advertising metrics. A maximum of 6 metrics can be selected at any given time.

4. Navigate to the Top movers' section: Clicking on this icon navigates the page to the top movers' widgets and shows you to the top drivers of the selected metrics.

5. Roll-up: The data on the graph can be rolled up by weeks or months. This option makes the analysis easier to analyze data on a large date range.

6. Download: Download the data on all the metrics that are selected on the widget in Excel.

7. Export: Download the reports as high fidelity PDF for collaboration and offline review purposes.

8. Views: Save the combination of your favorite metrics and drill-downs as "views" and access them in 1 click.

2. Top Movers

The top movers section helps you understand the top drivers of performance by surfacing the top movers across any metrics and any dimension within the taxonomy. It also helps connect SKU level performance to recommendations.

1. Metrics selection: This allows you to select the metrics for which you want to see the top drivers.

2. Show by: Allows you to select the business lines or brands for which you want to see the top drivers.

3. Benchmark: You can select business lines or brands using the checkboxes in the tables and analyze those selected business lines in the Benchmarking widget.

4. Download: Downloads an Excel with the list of top gainers and losers of the selected business line for the metrics.

5. SKU details page: Analyze the SKU level details by clicking on the title and navigating to SKU Details Page (SDP) within the CommerceIQ application.

3. **Benchmarking** :

Compare performance for multiple business lines or brands for any of the metrics both in a graphical and tabular format.

1. Business line or brand selection: Select the business line or brands which you would want to benchmark and compare.

2. Adding an entity: Add more business lines or brands to compare against.

3. Metrics selection: Select any metrics to benchmark against.

4. Selection dropdown: Change the business line or brand which are to be benchmarked.

5. Graph: Click on the icon to plot the graph of the metric for the selected entities.

6. Remove benchmark: Remove benchmarked entities.

7. Reorder: Click and drag the icon reorder benchmarked entities.

8. Download: Downloads an Excel with the details of the benchmarked entities.

Details of Shortages

- Performance Overview: Client can track PQV shortage disputes and dispute approval using the line graph. They may also change the metrics they are viewing to measure things like how well they are performing as a % of Shipped COGS.

- Top Contributors By: Clients can quickly identify problem areas by drilling down to the Top ASIN, Amazon Fulfillment Center (FC), and Purchase Order (PO), to identify any major contributors to shortages within the set timeline.

- Purchase Orders with Shortages: Clients can view granular data at an PO-ASIN level to track CIQ's status on disputes along with other relevant information regarding the shortage occurrences.

Details of Price Variances

- Performance Overview: Client can track PPV shortage disputes and dispute approval using the line graph. They may also change the metrics they are viewing to measure things like how well they are performing as a % of Shipped COGS.

- Purchase Orders with Price Variance: Client can view granular data at an PO-ASIN level to track CIQ's status on disputes along with other relevant information regarding the price variance occurrences.

Details of Chargebacks

- Chargeback Types/Performance Overview: Client can track chargebacks along with dispute progress over a given period of time. Clients can also drill down to a specific chargeback issue type by selecting a specific Chargeback Issue Type in the Chargeback Type section (just above Performance Overview).

- Top Contributors by Claims: Clients can quickly identify problem areas by drilling down to the Top ASIN, Amazon Fulfillment Center (FC), and Purchase Order (PO), to identify any major contributors to chargebacks within the set timeline. Clients can also filter to see chargebacks by their status (Charged, Disputed, Dispute Approved, etc.).

- Purchase Orders with Chargeback Claims: Clients can view granular data at an PO-ASIN level to track CIQ's status on disputes along with other relevant information regarding the chargeback occurrences.

Details of Co-op:

- Our automations can look back for co-op invoices dated in the last 24 months from the current month. It is recommended that while selecting the date ranges in the calendar of the dashboard, users select an end date that is one full quarter before the current quarter. This is because many invoices from the current quarter would still be going through their respective payment cycle and the "invalid deductions" bucket could potentially be artificially inflated.
  For example - If a user were to refresh the co-op dashboard in March 2024, they may choose the date range between Jan 2022 to Sep 2023, or any time in between that range. Please also note that this dashboard has been integrated with intercom to provide tooltip information at both widget and metric level.

- Deduction Overview: This widget is anchored around the co-op invoice date i.e. the date on which Amazon submitted a co-op invoice to a vendor and aims to draw contrasts between gross sales and co-op deductions levied by amazon for the selected time period. Gross sales are derived by calculating the total dollar amount invoiced by a vendor to amazon for payment

- Recovery Overview for Accruals: This widget is anchored around the co-op invoice date i.e. the date on which Amazon submitted a co-op invoice to a vendor and provides visibility into all metrics relevant to co-op deductions while also showcasing how these metrics trend over time.

- Co-op deductions comprise of various sub-types such as Accruals, Vendor Funded Sales Discounts, Straight Payments etc., and this data can be tracked under the Co Op section of Vendor Central (Payments > Co Op). However, at this point in time, CommerceIQ's automations only go after the Accrual sub-type of co-op deductions, which typically happens to be the biggest contributor to a brand's overall co-op deductions.

- Co-op Deductions Journey Map: This widget is anchored around the co-op invoice date i.e. the date on which Amazon submitted a co-op invoice to a vendor and provides visibility into the subsequent journey of these deductions. This journey map also provides an export option that enables users to download the underlying data that powers this chart for purposes such as reporting, auditing etc.

- Split of Co-op Deductions: This widget is anchored around the co-op invoice date i.e. the date on which Amazon submitted a co-op invoice to a vendor and provides the dollars distribution between the different types of co-op deductions incurred by the vendor for the selected period. Co-op deductions comprise of various sub-types such as Accruals, Vendor Funded Sales Discounts, Straight Payments etc., and this data can be tracked under the Co Op section of Vendor Central (Payments > Co Op). However, at this point in time, CommerceIQ's dispute automations only go after the Accrual sub-type of co-op deductions, which typically happens to be the biggest contributor to a brand's overall co-op deductions.

- All Co-op Invoices: This widget allows users to view and download all co-op invoices for the selected period. This data can also be found under Payments > Co Op on Vendor Central.

Details of Deductions Overview:

- Receivables Breakdown: This widget aims to draw contrasts between gross sales and all the deductions imposed by amazon on gross sales. Gross sales are derived by calculating the total dollar amount invoiced by a vendor to amazon for payment. This widget is anchored around the invoice date i.e. the date on which a vendor submitted an invoice to Amazon for payment, and shows the subsequent deductions, disputes and repayments (if any) against the same invoices. The chart presented does not adhere to a consistent scale, and all the deduction bars have been maximized to ensure proper visibility, given the significant disparity between values.

- Breakdown by Deduction Type: This widget breaks down deductions by their various types and contrasts the problem size between each of the deduction types. The data displayed in this widget is anchored around the invoice date i.e. the date on which a vendor submitted an invoice to Amazon for payment, and shows the subsequent deductions (both valid and invalid), disputes and repayments (if any) against the same invoices.The types of deductions include quantity shortages, price variance claims, co-op deductions, chargebacks and any quick pay discounts that a vendor may offer to amazon on an invoice for quicker payments.

Details of Shipment Tracker

List below gives detailed information about shipments at the Purchase Order (PO) and SKU level. Here's a breakdown of the key columns in downloadable export:

PO Number: The unique identifier for each Purchase Order.
PO Status: The current status of the PO (e.g., Confirmed).
Ordered On: The date the order was placed.
Ship Window Start/End: The time frame during which the shipment is expected to be dispatched.
Vendor Code: The identifier for the vendor.
Ship To Location: The Amazon fulfillment center where the shipment is being sent.
SKU Detail: The SKU (Stock Keeping Unit) identifier for the product.
Product Title: The name of the product associated with the SKU.
Ordered Quantity (Cases): The number of cases ordered.
Accepted Quantity (Cases): The number of cases accepted by the vendor.
Received Quantity (Cases): The number of cases received by Amazon.
Outstanding Quantity (Cases): The difference between the ordered and received quantities.
Received Percentage: The percentage of ordered cases that have been received.
Case Size: The size of each case.
Case Cost: The cost per case.
Total Cost: The total cost of the received cases.
